

SOFTWARE DEVELOPMENT CAPSTONE PROJECT

Food Order management System

Submitted to:

Md. Julkar Nayeem Mahi

Lecturer, Department of Software
Engineering, Daffodil International University

Intoduction

Online food ordering systems are growing in popularity as technology advances. This is so that they can meet the always growing need for persuasion. An online ordering system's primary function is to give customers a way to order from a restaurant online.

Features

Simple and minimal

Easy to manage

Customer Friendly

The main reason of a Food order management system is that it benefits both the customer and the business. With a website or mobile app, customers can easily browse all the dishes the restaurant has available, customize dishes to their requirements and place an order. It can also save their favourite orders allowing them to easily re-order that in the future.

From the restaurants perspective, they no longer spend time taking the customers order, stop worrying about communication errors and streamline their order management workflow.

Our Key Features

- Fully featured Administration Section
- More specifically customer friendly Customer Section
- Easy to use and faster
